Surgical Aspects of Ovarian Tissue Removal and Ovarian Tissue Transplantation for Fertility Preservation

Beckmann MW et al. Surgical Aspects of... Geburtsh Frauenheilk 2016; 76: 1057–1064

Investigated surgical criterion	Options	Articles
Surgical approach for ovarian tissue transplantation	Laparotomy Laparoscopy Laparoscopy + laparotomy	[12, 24] [9, 10, 13, 16, 17, 19, 22, 25] [18, 21]
Graft site	Peritoneal pocket in the pelvic wall near the ovary Ipsilateral ovary Contralateral ovary Ipsilateral or contralateral ovary Ipsilateral and contralateral ovary at the same time Heterotopic transplantation into abdominal subcutaneous fat tissue	[9, 10, 12, 13, 15–18, 21, 22, 25] [9, 15, 18] [12, 13] [10, 17, 21, 22, 25] [19, 24] [15, 17, 21, 25]
Instruments used during transplantation	Scissors or scalpel without coagulation Biopsy forceps	[9] [22]
Surgical treatment of the transplant site	No closure of the peritoneum after transplantation Sutures used to close the peritoneum after transplantation Fibrin glue used to close the peritoneum after transplantation Fixation of the transplant using fibrin glue No coagulation of the peritoneum Coagulation of the peritoneum	[9] [10, 12, 18, 19, 22] [10, 12] [10, 12] [9] keine Daten
Simultaneous surgical procedures performed during transplantation	Chromotubation Placement of drains	[9] [9]

Operative techniques and complications of extraction and transplantation of ovarian tissue: the Erlangen experience

Beckmann MW et al. Operative techniques and ... Arch Gynecol Obstet (2017) 295:1033–1039

The following schedule is used for ovarian tissue transplantation:

- The patient is placed in the lithotomy position, followed by vaginal disinfection, hooking of the portio, testing of probe length, and hysteroscopy. Any pathological tissue that may be present is removed if feasible. Insertion of a catheter, connection of the catheter with a syringe with sterile saline.
- Abdominal disinfection, sterile draping, subumbilical stab incision. Insertion of the Veress needle. If the safety test is unremarkable, insufflation of CO₂ gas until a hyperresonant percussion sound is present in all four quadrants. Insertion of the trocar and optics under visual guidance.
- 360° inspection, with imaging of the upper and lower abdominal organs. Documentation of any pathology.
- After a caudal stab incision, correct positioning of three 5-mm trocars in the lower abdomen.
- Imaging of the internal genitals, with identification of the uterus, fallopian tubes bilaterally, ovaries bilaterally, lateral pelvic vessels, and the course of the ureter. Documentation of any sites of probable pathology and removal of any pathological tissue if present and feasible.
- Testing the patency of the fallopian tubes.

Operative techniques and complications of extraction and transplantation of ovarian tissue: the Erlangen experience

Beckmann MW et al. Operative techniques and ... Arch Gynecol Obstet (2017) 295:1033–1039

The following schedule is used for ovarian tissue transplantation:

- Dissection of a peritoneal pouch on the side of the previously removed ovarian tissue:
 - Grasping of the peritoneum.
 - Bloodless lancing of the peritoneum with scissors.
 - Blunt dissection, without bleeding, of a peritoneal pouch at least 2.0 × 2.0 cm in size.
 - Checking that there is no bleeding and insertion of the 10–15 prepared particles of ovarian tissue into the peritoneal pouch.
 - (The decision for the number of particles being transplanted is based on the patient's wish and the amount of available ovarian tissue.)
 - Filling of the pouch, spontaneous occlusion with sufficiently wide dissection and loose insertion of the ovarian tissue particles.
 - (Suturing, or adhesive dressing—only applied if there is no complete spontaneous occlusion of the pouch.)
- Removal of the instruments, wound closure, sterile wound dressing.

Problems of Fertility protection focussed on technical aspects of removal and transplantation of ovarian tissue

Lack of published information

- about details of technical aspects (surgery, freezing)
- about complications of various technical aspects
- about patients' characteristics (i.e. oncological therapy)
- about the success rates (definition?)
- about long term outcome including survival

No comparision between different groups due to individual modifications!

Consensus conference including foundation of an international data base.

Evaluation of the transplant register of FertiPROTEKT (Centers in D, A, CH):

- Transplanted patients: 107 transplanted patients: by 01.02.2017
- Births: 28 pregnancies with meanwhile 20 births in 16 patients
- Pregnancy rate of patients transplanted until the end of October 2016: 23%
- Average age at collection: 29.6 years; at transplantation: 34.1 years (average storage time 4.6 years)
